

This is an *optional* project whose value will depend on how many students attempt it and the quality of analysis. The project is potentially very fun, so this alone is reason to at least take a look. I'm attaching an unstructured data file `UFO.zip` that has several years' worth of reports on UFOs. You should perform your own data mining, but in addition, I am interested in knowing:

- Are the majority of witnesses male or female?
- Are the siting in the U.S. located to a particular region or time?
- It's often claimed (popularly) that sitings are most common on Tuesday or Wednesday. Is this consistent with the data?

As with any data mining project, you'll have to peruse the file to make sense of the data, type, meaning, *etc.*

This homework is due Friday December 20, 2013 3:00 p.m. **No late submissions will be accepted.**
